## CHAPTER 4

Slide 4.2

# TEAMS

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Overview

Slide 4.3

- Team organization
- Democratic team approach
- Classical chief programmer team approach
- Beyond chief programmer and democratic teams
- Synchronize-and-stabilize teams
- Teams for agile processes
- Open-source programming teams
- People capability maturity model
- Choosing an appropriate team organization

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## 4.1 Team Organization

Slide 4.4

- A product must be completed within 3 months, but 1 person-year of programming is still needed
- Solution:
  - If one programmer can code the product in 1 year, four programmers can do it in 3 months
- Nonsense!
  - Four programmers will probably take nearly a year
  - The quality of the product is usually lower

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Task Sharing

Slide 4.5

- If one farm hand can pick a strawberry field in 10 days, ten farm hands can pick the same strawberry field in 1 day
- One elephant can produce a calf in 22 months, but 22 elephants cannot possibly produce that calf in 1 month

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Task Sharing (contd)

Slide 4.6

- Unlike elephant production, it is possible to share coding tasks between members of a team
- Unlike strawberry picking, team members must interact in a meaningful and effective way

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Programming Team Organization

Slide 4.7

- Example:
  - Sheila and Harry code two modules,  $m_1$  and  $m_2$ , say
- What can go wrong
  - Both Sheila and Harry may code  $m_1$ , and ignore  $m_2$
  - Sheila may code  $m_1$ , Harry may code  $m_2$ . When  $m_1$  calls  $m_2$  it passes 4 parameters; but  $m_2$  requires 5 parameters
  - Or, the order of parameters in  $m_1$  and  $m_2$  may be different
  - Or, the order may be same, but the data types may be slightly different

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Programming Team Organization (contd)

Slide 4.8

- This has nothing whatsoever to do with technical competency
  - Team organization is a managerial issue

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Communications Problems

Slide 4.9

### □ Example

- There are three channels of communication between the three programmers working on a project. The deadline is rapidly approaching but the code is not nearly complete

### □ “Obvious” solution:

- Add a fourth programmer to the team

Figure 4.1

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Communications Problems (contd)

Slide 4.10

- But other three have to explain in detail
  - What has been accomplished
  - What is still incomplete
- Brooks's Law
  - Adding additional programming personnel to a team when a product is late has the effect of making the product even later

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Team Organization

Slide 4.11

- Teams are used throughout the software production process
  - But especially during implementation
  - Here, the discussion is presented within the context of programming teams
- Two extreme approaches to team organization
  - Democratic teams (Weinberg, 1971)
  - Chief programmer teams (Brooks, 1971; Baker, 1972)

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## 4.2 Democratic Team Approach

Slide 4.12

- Basic underlying concept — *egoless programming*
- Programmers can be highly attached to their code
  - They even name their modules after themselves
  - They see their modules as extension of themselves

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Democratic Team Approach (contd)

Slide 4.13

- If a programmer sees a module as an extension of his/her ego, he/she is not going to try to find all the errors in “his”/“her” code
  - If there is an error, it is termed a *bug* 🐛
  - The fault could have been prevented if the code had been better guarded against the “bug”
  - “Shoo-Bug” aerosol spray

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Democratic Team Approach (contd)

Slide 4.14

- Proposed solution
- Egoless programming
  - Restructure the social environment
  - Restructure programmers’ values
  - Encourage team members to find faults in code
  - A fault must be considered a normal and accepted event
  - The team as whole will develop an ethos, a group identity
  - Modules will “belong” to the team as whole
  - A group of up to 10 egoless programmers constitutes a *democratic team*

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Difficulties with Democratic Team Approach

Slide 4.15

- Management may have difficulties
  - Democratic teams are hard to introduce into an undemocratic environment

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Strengths of Democratic Team Approach

Slide 4.16

- Democratic teams are enormously productive
- They work best when the problem is difficult
- They function well in a research environment
- Problem:
  - Democratic teams have to spring up spontaneously

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## 4.3 Classical Chief Programmer Team Approach

Slide 4.17

- Consider a 6-person team
  - Fifteen 2-person communication channels
  - The total number of 2-, 3-, 4-, 5-, and 6-person groups is 57
  - This team cannot do 6 person-months of work in 1 month

Figure 4.2

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Classical Chief Programmer Team

Slide 4.18

Figure 4.3

- Six programmers, but now only 5 lines of communication

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Classical Chief Programmer Team (contd)

Slide 4.19

- The basic idea behind the concept
  - Analogy: chief surgeon directing an operation, assisted by
    - » Other surgeons
    - » Anesthesiologists
    - » Nurses
    - » Other experts, such as cardiologists, nephrologists
- Two key aspects
  - Specialization
  - Hierarchy

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Classical Chief Programmer Team (contd)

Slide 4.20

- Chief programmer
  - Successful manager *and* highly skilled programmer
  - Does the architectural design
  - Allocates coding among the team members
  - Writes the critical (or complex) sections of the code
  - Handles all the interfacing issues
  - Reviews the work of the other team members
  - Is personally responsible for every line of code

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Classical Chief Programmer Team (contd)

Slide 4.21

- Back-up programmer
  - Necessary only because the chief programmer is human
  - The back-up programmer must be in every way as competent as the chief programmer, and
  - Must know as much about the project as the chief programmer
  - The back-up programmer does black-box test case planning and other tasks that are independent of the design process

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Classical Chief Programmer Team (contd)

Slide 4.22

- Programming secretary
  - A highly skilled, well paid, central member of the chief programmer team
  - Responsible for maintaining the program production library (documentation of the project), including:
    - » Source code listings
    - » JCL
    - » Test data
  - Programmers hand their source code to the secretary who is responsible for
    - » Conversion to machine-readable form
    - » Compilation, linking, loading, execution, and running test cases (this was 1971, remember!)

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Classical Chief Programmer Team (contd)

Slide 4.23

- Programmers
  - Do nothing but program
  - All other aspects are handled by the programming secretary

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## The *New York Times* Project

Slide 4.24

- Chief programmer team concept
  - First used in 1971
  - By IBM
  - To automate the clippings data bank (“morgue”) of the *New York Times*
- Chief programmer — F. Terry Baker

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## The *New York Times* Project (contd)

Slide 4.25

- ❑ 83,000 source lines of code (LOC) were written in 22 calendar months, representing 11 person-years
- ❑ After the first year, only the file maintenance system had been written (12,000 LOC)
- ❑ Most code was written in the last 6 months
- ❑ Only 21 faults were detected in the first 5 weeks of acceptance testing

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## The *New York Times* Project (contd)

Slide 4.26

- ❑ 25 further faults were detected in the first year of operation
- ❑ Principal programmers averaged one detected fault and 10,000 LOC per person-year
- ❑ The file maintenance system, delivered 1 week after coding was completed, operated 20 months before a single failure occurred
- ❑ Almost half the subprograms (usually 200 to 400 lines of PL/I) were correct at first compilation

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## The New York Times Project (contd)

Slide 4.27

- But, after this fantastic success, no comparable claims for the chief programmer team concept have been made

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Why Was the *NYT* Project Such a Success?

Slide 4.28

- Prestige project for IBM
  - First real trial for PL/I (developed by IBM)
  - IBM, with superb software experts, used its best people
- Extremely strong technical backup
  - PL/I compiler writers helped the programmers
  - JCL experts assisted with the job control language

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Why Was the *NYT* Project Such a Success?

Slide 4.29

- F. Terry Baker
  - Superprogrammer
  - Superb manager and leader
  - His skills, enthusiasm, and personality “carried” the project
- Strengths of the chief programmer team approach
  - It works
  - Numerous successful projects have used variants of CPT

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Impracticality of Classical CPT

Slide 4.30

- The chief programmer must be a highly skilled programmer *and* a successful manager
- There is a shortage of highly skilled programmers
- There is a shortage of successful managers
- The qualities needed to be a highly skilled programmer are unlikely to be found in a successful manager, and vice versa

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Impracticality of Classical CPT (contd)

Slide 4.31

- The *back-up programmer* must be as good as the chief programmer
  - But he/she must take a back seat (and a lower salary) waiting for something to happen to the chief programmer
  - Top programmers, top managers will not do that
- The *programming secretary* does nothing but paperwork all day
  - Software professionals hate paperwork
- Classical CPT is impractical

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## 4.4 Beyond CP and Democratic Teams

Slide 4.32

- We need ways to organize teams that
  - Make use of the strengths of democratic teams and chief programmer teams, and
  - Can handle teams of 20 (or 120) programmers
- A strength of democratic teams
  - A positive attitude to finding faults
- Use CPT in conjunction with code walkthroughs or inspections

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Beyond CP and Democratic Teams (contd)

Slide 4.33

- Potential pitfall
  - The chief programmer is personally responsible for every line of code
    - He/she must therefore be present at reviews
  - The chief programmer is also the team manager
    - He/she must therefore *not* be present at reviews!

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Beyond CP and Democratic Teams (contd)

Slide 4.34

Figure 4.4

- Solution
  - Reduce the managerial role of the chief programmer

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Beyond CP and Democratic Teams (contd)

Slide 4.35

- It is easier to find a team leader than a chief programmer
- Each employee is responsible to exactly one manager — lines of responsibility are clearly delineated
- The team leader is responsible for only technical management

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Beyond CP and Democratic Teams (contd)

Slide 4.36

- Budgetary and legal issues, and performance appraisal are not handled by the team leader
- The team leader participates in reviews — the team manager is not permitted to do so
- The team manager participates in regular team meetings to appraise the technical skills of the team members

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Larger Projects

Slide 4.37

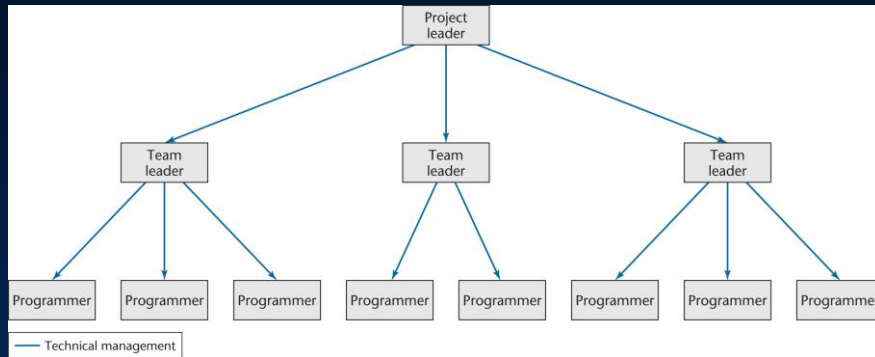

Figure 4.5

- The nontechnical side is similar
  - For even larger products, add additional layers

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Beyond CP and Democratic Teams (contd)

Slide 4.38

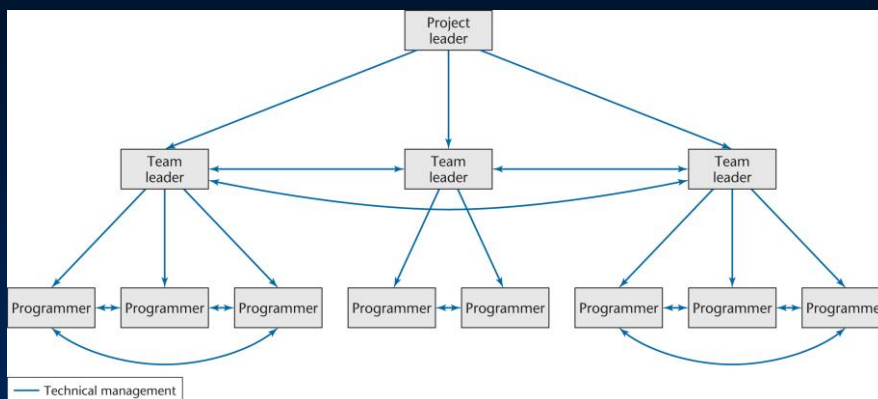

Figure 4.6

- Decentralize the decision-making process, where appropriate
  - Useful where the democratic team is good

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## 4.5 Synchronize-and-Stabilize Teams

Slide 4.39

- Used by Microsoft
- Products consist of 3 or 4 sequential builds
- Small parallel teams
  - 3 to 8 developers
  - 3 to 8 testers (work one-to-one with developers)
  - The team is given the overall task specification
  - They may design the task as they wish

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Synchronize-and-Stabilize Teams (contd)

Slide 4.40

- Why this does not degenerate into hacker-induced chaos?
  - Daily synchronization step
  - Individual components always work together

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Synchronize-and-Stabilize Teams (contd)

Slide 4.41

### □ Rules

- Programmers must adhere to the time for entering the code into the database for that day's synchronization

### □ Analogy

- Letting children do what they like all day...
- ... but with a 9 P.M. bedtime

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Synchronize-and-Stabilize Teams (contd)

Slide 4.42

### □ Will this work in all companies?

- Perhaps if the software professionals are as good as those at Microsoft

### □ Alternate viewpoint

- The synchronize-and-stabilize model is simply a way of allowing a group of hackers to develop large products
- Microsoft's success is due to superb marketing rather than quality software

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## 4.6 Teams For Agile Processes

Slide 4.43

- Feature of agile processes
  - All code is written by two programmers sharing a computer
  - “Pair programming”

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Strengths of Pair Programming

Slide 4.44

- Programmers should not test their own code
  - One programmer draws up the test cases, the other tests the code
- If one programmer leaves, the other is sufficiently knowledgeable to continue working with another pair programmer
- An inexperienced programmer can learn from his or her more experienced team member
- Centralized computers promote egoless programming

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Experiment on Pair Programming

Slide 4.45

- ❑ Experiment of Arisholm, Gallis, Dybå, and Sjøberg (2007)
- ❑ A total of 295 professional programmers (99 individuals and 98 pairs) were hired to take part in a carefully conducted one-day experiment on pair programming
- ❑ The subjects were required to perform several maintenance tasks on two Java software products, one simple and one complex

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Experiment on Pair Programming (contd)

Slide 4.46

- ❑ The pair programmers required 84 per cent more effort to perform the tasks correctly
- ❑ In the light of this result, some software engineers may reconsider using pair programming, and, hence, agile processes

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Experiment on Pair Programming (contd)

Slide 4.47

- Also, in 2007 Dybå et al. analyzed 15 published studies comparing the effectiveness of individual and pair programming
- Conclusion:
  - It depends on both the programmer's expertise and the complexity of the system and the specific tasks to be solved
- Clearly, more research, performed on large samples of professional programmers, needs to be conducted

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## 4.7 Open-Source Programming Teams

Slide 4.48

- Open-source projects
  - Are generally staffed by teams of unpaid volunteers
  - Who communicate asynchronously (via e-mail)
  - With no team meetings and
  - With no managers
  - There are no specifications or designs, and
  - Little or no other documentation
- So, why have a small number of open-source projects (such as Linux and Apache) attained the highest levels of success?

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Open-Source Programming Teams (contd)

Slide 4.49

- Individuals volunteer to take part in an open-source project for two main reasons
- Reason 1: For the sheer enjoyment of accomplishing a worthwhile task
  - In order to attract and keep volunteers, they have to view the project as “worthwhile” at all times
- Reason 2: For the learning experience

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## The Open-Source Learning Experience

Slide 4.50

- Software professionals often join an open-source project to gain new skills
  - For a promotion, or
  - To get a better job elsewhere
- Many employers view experience with a large, successful open-source project as better than additional academic qualifications

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Open-Source Programming Teams (contd)

Slide 4.51

- The members of the open-source team must at all times feel that they are making a contribution
- For all these reasons, it is essential that the key individual behind an open-source project be a superb motivator
  - Otherwise, the project is doomed to inevitable failure

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Open-Source Programming Teams (contd)

Slide 4.52

- For a successful open-source project, the members of the core group must be top-caliber individuals with skills of the highest order
- Such top-class individuals can thrive in the unstructured environment of an open-source team

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Open-Source Programming Teams (contd)

Slide 4.53

- In summary, an open-source project succeeds because of
  - The nature of the target product,
  - The personality of the instigator, and
  - The talents of the members of the core group
- The way that a successful open-source team is organized is essentially irrelevant

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## 4.8 People Capability Maturity Model

Slide 4.54

- Best practices for managing and developing the workforce of an organization
- Each maturity level has its own KPAs
  - Level 2: Staffing, communication and coordination, training and development, work environment, performance management, coordination
  - Level 5: Continuous capability improvement, organizational performance alignment, continuous workforce innovation

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## People Capability Maturity Model (contd)

Slide 4.55

- P-CMM is a framework for improving an organization's processes for managing and developing its workforce
- No one specific approach to team organization is put forward

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## 4.9 Choosing an Appropriate Team Organization

Slide 4.56

- There is no one solution to the problem of team organization
- The “correct” way depends on
  - The product
  - The outlook of the leaders of the organization
  - Previous experience with various team structures

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Choosing an Appropriate Team Organization (contd)

Slide 4.57

- Exceedingly little research has been done on software team organization
  - Instead, team organization has been based on research on group dynamics in general
- Without *relevant* experimental results, it is hard to determine optimal team organization for a specific product

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.

## Choosing an Appropriate Team Organization (contd)

Slide 4.58

| Team Organization                                      | Strengths   | Weaknesses   |
|--|---|--|
| Democratic teams<br>(Section 4.2)                      | High-quality code as consequence of positive attitude to finding faults<br>Particularly good with hard problems   | Experienced staff resent their code being appraised by beginners<br>Cannot be externally imposed                 |
| Classical chief programmer teams<br>(Section 4.3)      | Major success of <i>The New York Times</i> project  | Impractical  |
| Modified chief programmer teams<br>(Section 4.3.1)     | Many successes  | No successes comparable to <i>The New York Times</i> project   |
| Modern hierarchical programming teams<br>(Section 4.4) | Team manager/team leader structure obviates need for chief programmer<br>Scales up<br>Supports decentralization when needed   | Problems can arise unless areas of responsibility of the team manager and the team leader are clearly delineated |
| Synchronize-and-stabilize teams<br>(Section 4.5)       | Encourages creativity<br>Ensures that a huge number of developers can work toward a common goal   | No evidence so far that this method can be utilized outside Microsoft  |
| Agile process teams<br>(Section 4.6)                   | Programmers do not test their own code<br>Knowledge is not lost if one programmer leaves<br>Less-experienced programmers can learn from others<br>Group ownership of code | Still too little evidence regarding efficacy   |
| Open-source teams<br>(Section 4.7)                     | A few projects are extremely successful   | Narrowly applicable<br>Must be led by a superb motivator<br>Requires top-caliber participants                    |

Figure 4.7

Copyright © 2011 by The McGraw-Hill Companies, Inc. All rights reserved.
